

Because this box has been stripped down for easy handling, you should know some essential facts:

- See also : IPTV-Multicast-OMM15_Manual.1.4.pdf
- Factory defaults: It must be connected to the Internet to get the basic OS installed online
 - o After the installing of the basic OS it needs to get a script from a connected Linux Device running to prepare it for the Digital Signage / IPTV Multicast streaming's
 - o The STB displays Time and date information on the main screen so it needs a NTP connection either getting these from the router or from the internet.
 - o So it is almost helpful to have a tiny router installed which serves the boxes with small internet connection and also handles their DHCP.-IP addresses IPv4

We now like to give you a short introduction to setup a DHCP-Router for these boxes: Using a raspberry PI3/4 and its original Raspberry Pi OS: <https://www.raspberrypi.com/software/operating-systems/> and by acting under this tutorial: https://linuxhint.com/raspberry_pi_wired_router/

We assume that you are familiar with setting up a RPI: Download, use RPIImager and flash it. Then stay at the µSDCard by your windows/Linux-PC and add following to the USB-Boot-Folder:

Things You Need:

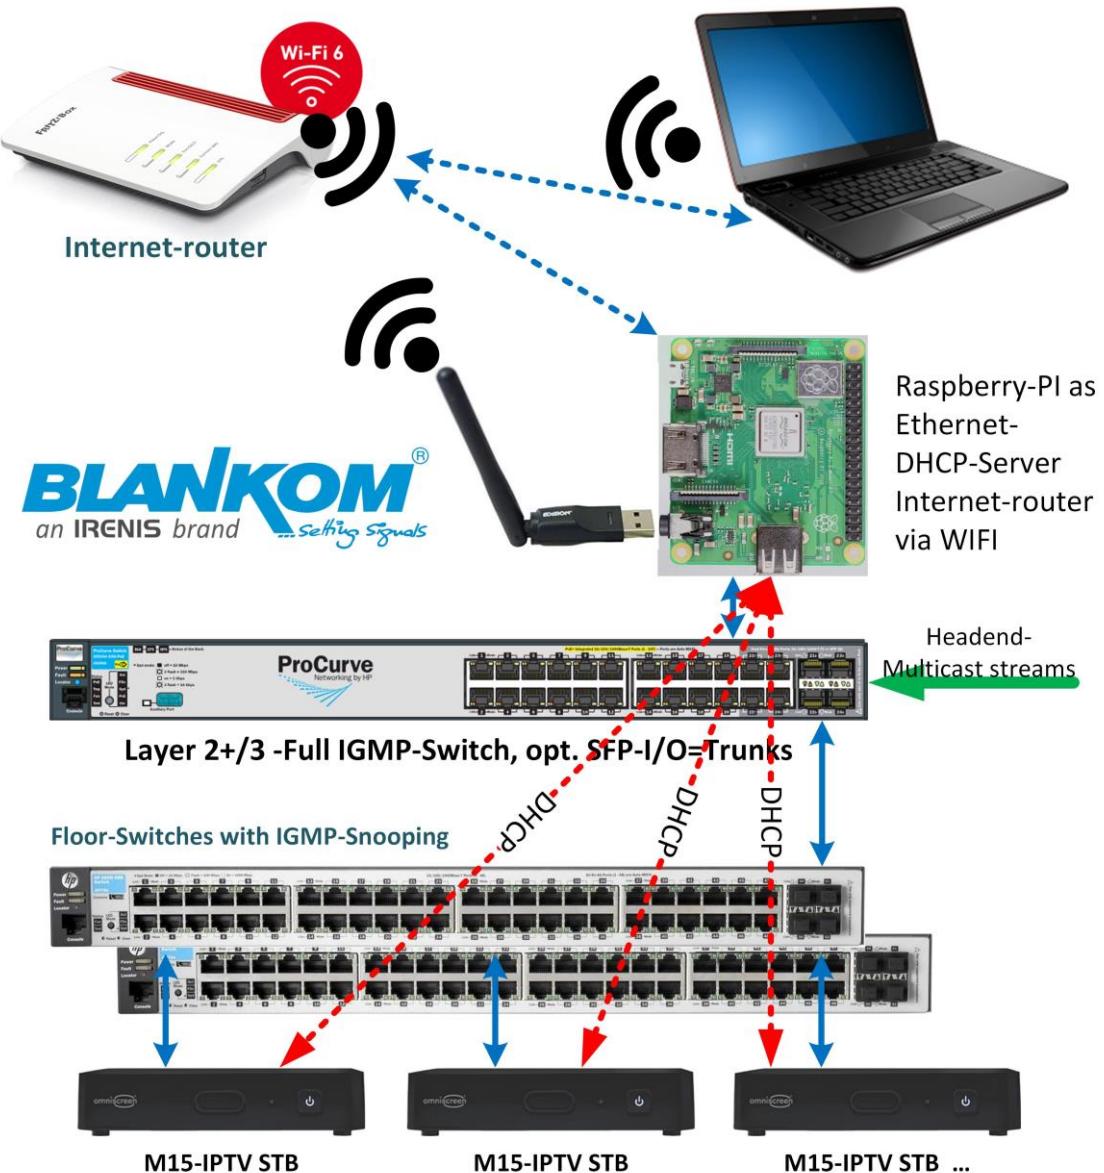

In order to configure your Raspberry Pi as a wired router, you need the following things:

- 1) A Raspberry Pi single board computer
- 2) A Raspberry Pi power adapter or a 2.1A USB power bank
- 3) A SD card reader for flashing Raspbian OS onto the microSD card.
- 4) A microSD card
- 5) A network switch (10/100/1000 or 100/1000 Autosensing)
- 6) Ethernet cables
- 7) A Wi-Fi network to connect the Raspberry Pi to
- 8) A computer/laptop for configuring the Raspberry Pi

In this example case, we have an external WIFI-USB-Stick connected to the PI and a WIFI-in Reach.

We are using for this tutorial an older RPI2-Model.

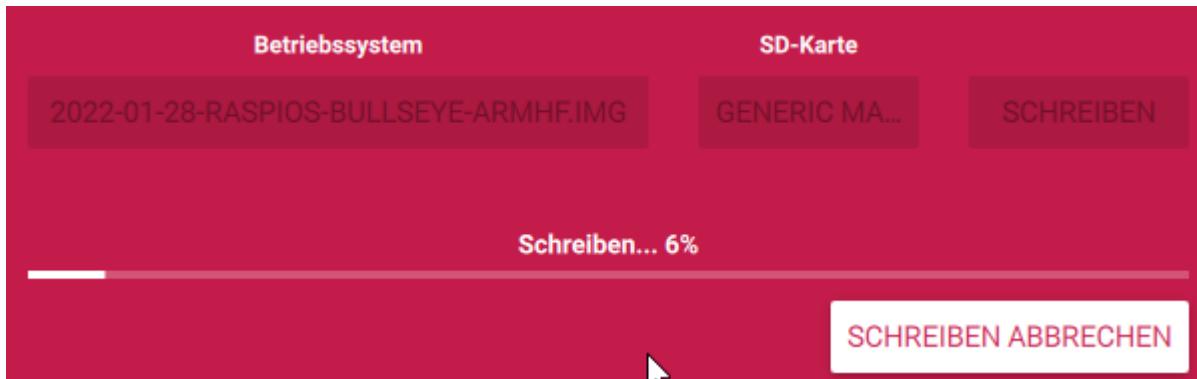

The Network-switches can be set to the static IP address ranges and been managed by a connected PC in the same static or dynamic range at the switches. The Raspi can be handled by a laptop in the same WIFI - See picture:

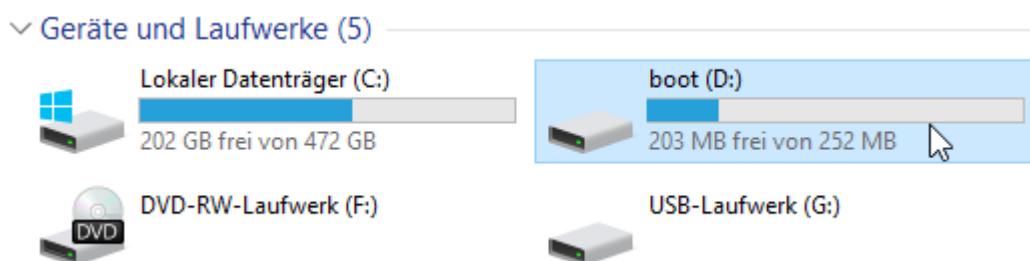

Flashing the OS:

Flashing:

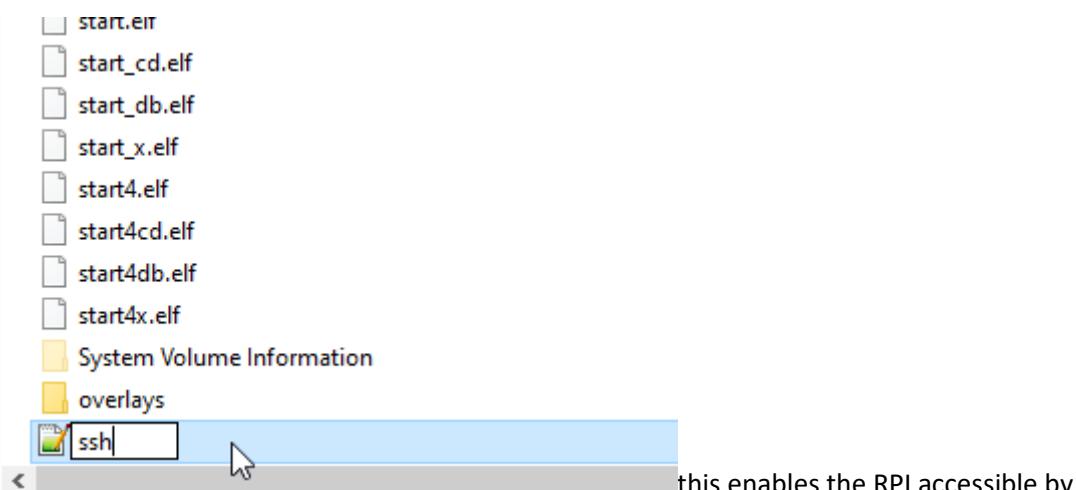

Re-Connect the USB-penkey: Now, you should see a **boot** drive on your computer. Navigate into it.

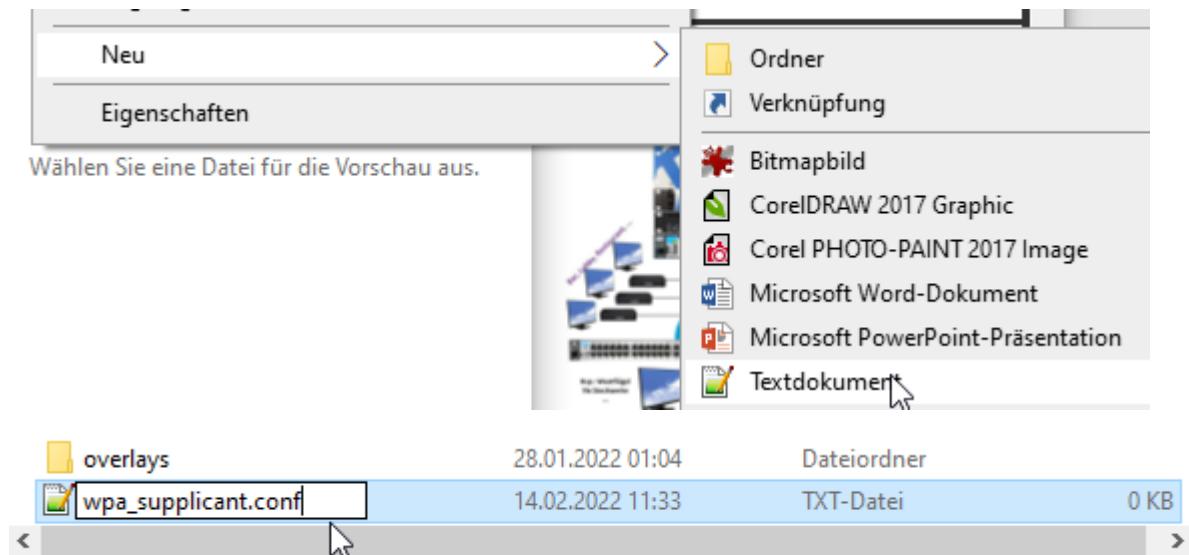

Do not format the 2nd linux partition (not visible under Windows)!!! Just go to the boot-partition and insert 2 files (use a notepad++ linux capable text editor – not a windows based please !:

Create an empty file named ssh

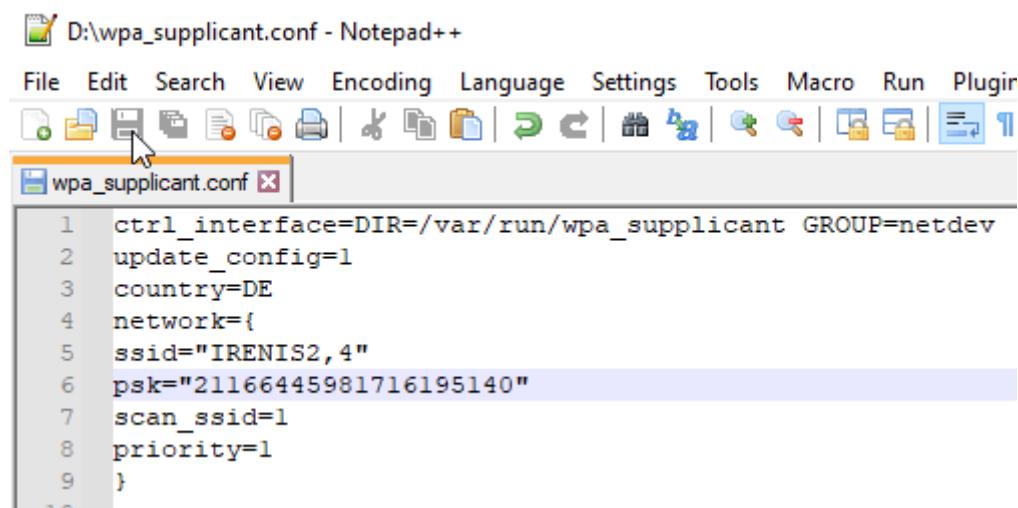

Create a new file **wpa_supplicant.conf** and type in the following lines to it:

```
ctrl_interface=DIR=/var/run/wpa_supplicant GROUP=netdev
update_config=1
country=US
network={
    ssid="YOUR_WIFI_SSID"
    psk="YOUR_WIFI_PASSWORD"
    scan_ssid=1
    priority=1
}
```

Change US to your land, DE in our case and here we use the I-Netrouter WIFI access:

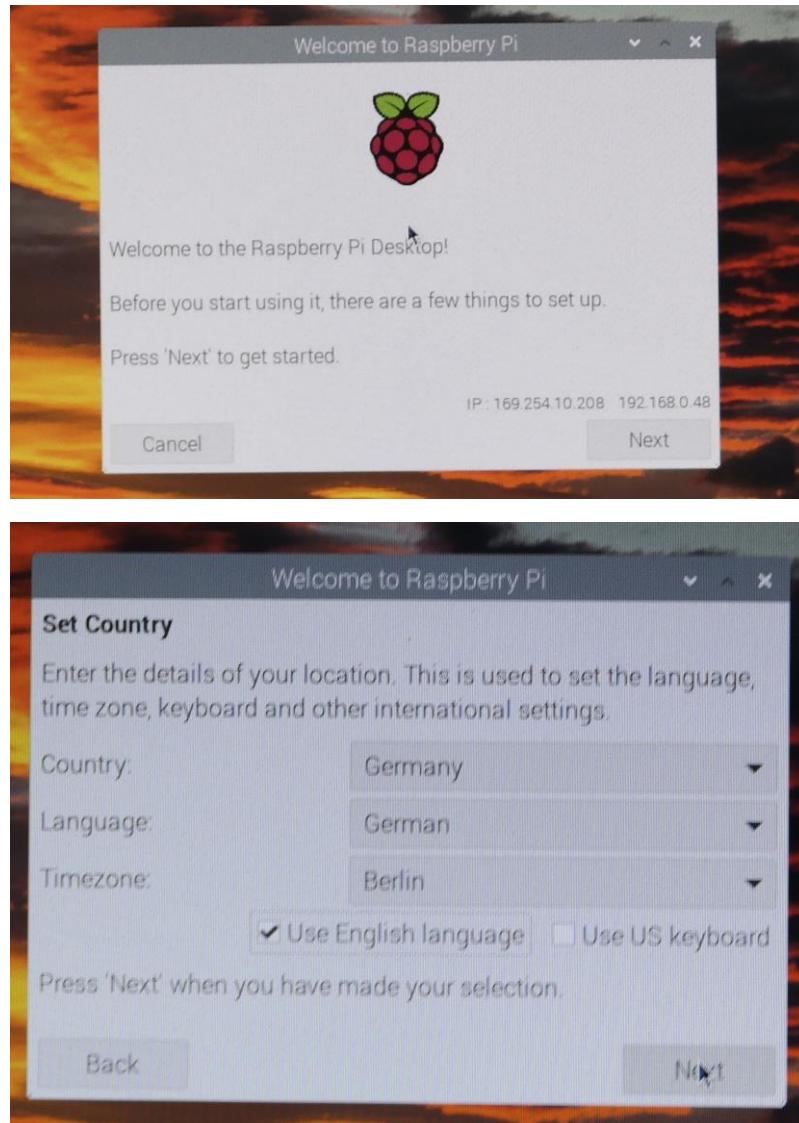

WIFI-PW= 21166445981716195140 , SSID = IRENIS2,4

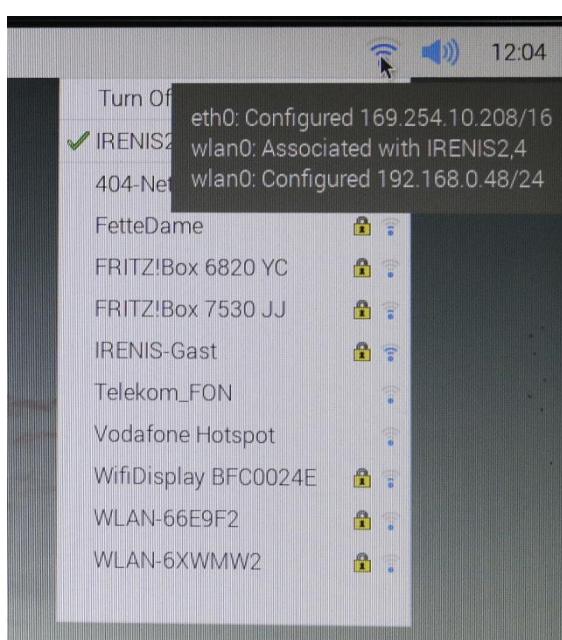

This file will be copied to the /etc/wpa... folder during/after boot.

Now it's time to eject the µSDcard and insert it into the RPI. Powering it up and connect the Switch with Ethernet before.

Let it boot, check connection and change the locales to your country and language in the next steps.

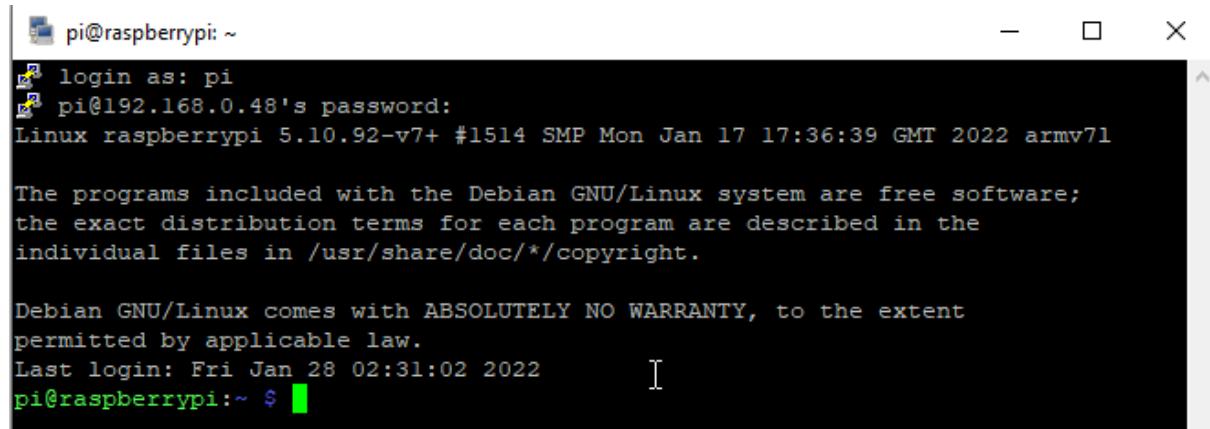

Select the WIFI access and let run the updates and check IP:

As you can see, the Ethernet port is not configured yet.

If you are running the RPI as headless device w/o a connected HDMI-Monitor, Check your router what IP address has been delivered to your RPI...

Terminal access by SSH with Putty or Kitty:

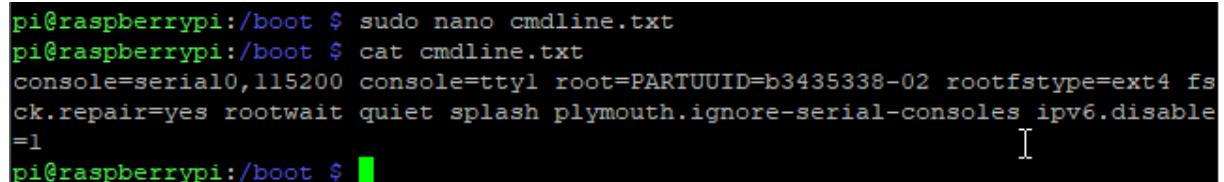

```
pi@raspberrypi: ~
pi@raspberrypi: ~ login as: pi
pi@192.168.0.48's password:
Linux raspberrypi 5.10.92-v7+ #1514 SMP Mon Jan 17 17:36:39 GMT 2022 armv7l

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/*copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Fri Jan 28 02:31:02 2022
pi@raspberrypi:~ $
```

Now, open the **cmdline.txt** file and add **ipv6.disable=1** at the end of the line to disable IPv6:

```
cd /boot
sudo nano cmdline.txt:
```

```
pi@raspberrypi:/boot $ sudo nano cmdline.txt
pi@raspberrypi:/boot $ cat cmdline.txt
console=serial0,115200 console=tty1 root=PARTUUID=b3435338-02 rootfstype=ext4 fsck.repair=yes rootwait quiet splash plymouth.ignore-serial-consoles ipv6.disable=1
pi@raspberrypi:/boot $
```

This may be done before the SDcard is inserted into the RPI.

Configuring the Network:

Now, create a network configuration file for **wlan0** network interface as follows:

```
$ sudo nano /etc/network/interfaces.d/wlan0
```

```
pi@raspberrypi:~ $ sudo nano /etc/network/interfaces.d/wlan0
```

Now, type in the following lines and save the configuration file by pressing <Ctrl> + X followed by Y and <Enter>.

```
allow-hotplug wlan0
iface wlan0 inet dhcp
wpa-conf /etc/wpa_supplicant/wpa_supplicant.conf
```

```
GNU nano 3.2                               /etc/network/interfaces.d/wlan0                         Modified
allow-hotplug wlan0
iface wlan0 inet dhcp
    wpa-conf /etc/wpa_supplicant/wpa_supplicant.conf
```

```
^G Get Help   ^O Write Out   ^W Where Is   ^K Cut Text   ^J Justify   ^C Cur Pos   M-U Undo
^X Exit       ^R Read File    ^\ Replace    ^U Uncut Text  ^T To Spell   ^_ Go To Line M-E Redo
```

Now, create a network configuration file for **eth0** network interface as follows:

```
$ sudo nano /etc/network/interfaces.d/eth0
```

```
pi@raspberrypi:~ $ sudo nano /etc/network/interfaces.d/eth0
```

Now, type in the following lines and save the configuration file by pressing **<Ctrl> + X** followed by **Y** and **<Enter>**.

```
auto eth0
iface eth0 inet static
address 192.168.1.1
netmask 255.255.255.0
```

Select the range you want to go with the STB's.
We keep it at 192.168.1.0/24...

Now, disable dhcpcd service with the following command:

```
$ sudo systemctl disable dhcpcd
```

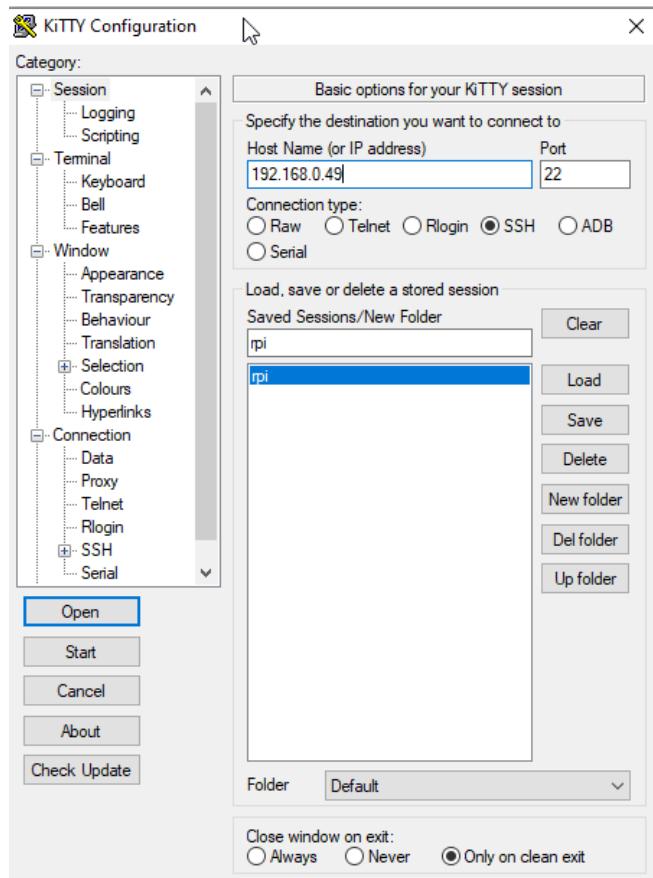

```
pi@raspberrypi:~ $ sudo systemctl disable dhcpcd
pi@raspberrypi:/boot $ sudo systemctl disable dhcpcd
Synchronizing state of dhcpcd.service with SysV service script with /lib/systemd/
/systemd-sysv-install.
Executing: /lib/systemd/systemd-sysv-install disable dhcpcd
Removed /etc/systemd/system/multi-user.target.wants/dhcpcd.service.
pi@raspberrypi:/boot $
```

Now, restart your Raspberry Pi for the changes to take effect. SUDO REBOOT ...
you know that

Once your Raspberry Pi starts, check the network configuration of **wlan0** network interface as follows:

```
$ ip addr show wlan0
```

wlan0 should get an IP address via DHCP But it can be a different than before

Also, check the network configuration of **eth0** network interface as follows:

```
$ ip addr show eth0
```

A static IP address should be assigned to the **eth0** network interface.

```
pi@raspberrypi:~ $ ip addr show eth0
2: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 1500 qdisc pfifo_fast state UP group default qlen 1000
    link/ether b8:27:eb:58:2b:59 brd ff:ff:ff:ff:ff:ff
    inet 192.168.1.1/24 brd 192.168.1.255 scope global eth0
        valid_lft forever preferred_lft forever
pi@raspberrypi:~ $
```

wlan0 and **eth0**, both should be configured correctly.

Configuring DHCP Server:

Now, update the APT package repository cache with the following command:

```
$ sudo apt update
```

```
pi@raspberrypi:~ $ sudo apt update
Hit:1 http://raspbian.raspberrypi.org/raspbian bullseye InRelease
Hit:2 http://archive.raspberrypi.org/debian bullseye InRelease
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
All packages are up to date.
pi@raspberrypi:~ $
```

Install ISC DHCP server with the following command:

```
$ sudo apt install isc-dhcp-server
```

```
pi@raspberrypi:~ $ sudo apt install isc-dhcp-server
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following package was automatically installed and is no longer required:
  libfuse2
Use 'sudo apt autoremove' to remove it.
The following additional packages will be installed:
  libirs-export161 libisccfg-export163 policycoreutils selinux-utils
Suggested packages:
  isc-dhcp-server-ldap
The following NEW packages will be installed:
  isc-dhcp-server libirs-export161 libisccfg-export163 policycoreutils
    selinux-utils
0 upgraded, 5 newly installed, 0 to remove and 0 not upgraded.
Need to get 1,592 kB of archives.
After this operation, 6,258 kB of additional disk space will be used.
Do you want to continue? [Y/n]
```

Off course Y

```

● isc-dhcp-server.service - LSB: DHCP server

pi@raspberrypi:~ $ .

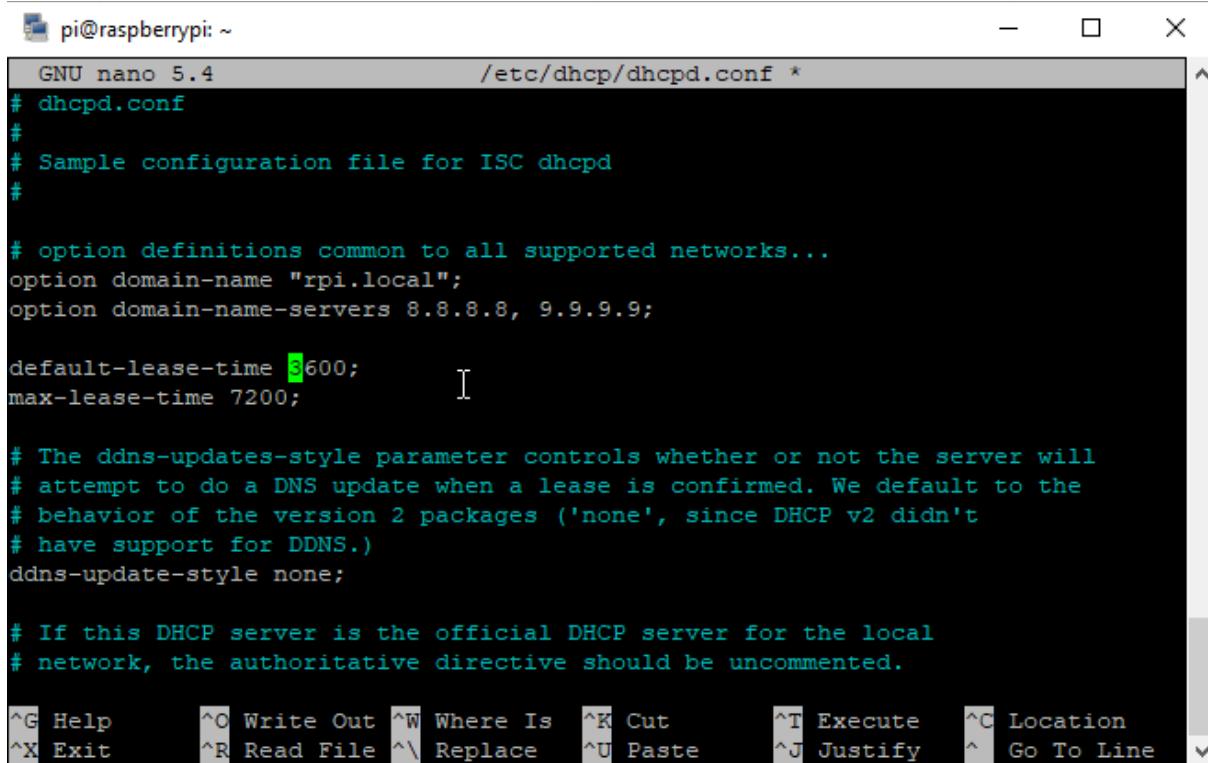

```

Now, open the **dhcpd.conf** file as follows:

```
$ sudo nano /etc/dhcp/dhcpd.conf
```

```
pi@raspberrypi:~ $ sudo nano /etc/dhcp/dhcpd.conf
```

Set the **domain-name** and **domain-name-servers** as follows.

```

pi@raspberrypi: ~
GNU nano 5.4          /etc/dhcp/dhcpd.conf *
# dhcpd.conf
#
# Sample configuration file for ISC dhcpcd
#
# option definitions common to all supported networks...
option domain-name "rpi.local";
option domain-name-servers 8.8.8.8, 9.9.9.9;

default-lease-time 3600;
max-lease-time 7200;

# The ddns-updates-style parameter controls whether or not the server will
# attempt to do a DNS update when a lease is confirmed. We default to the
# behavior of the version 2 packages ('none', since DHCP v2 didn't
# have support for DDNS.)
ddns-update-style none;

# If this DHCP server is the official DHCP server for the local
# network, the authoritative directive should be uncommented.

^G Help      ^O Write Out  ^W Where Is  ^K Cut      ^T Execute  ^C Location
^X Exit      ^R Read File  ^\ Replace   ^U Paste    ^J Justify  ^  Go To Line

```

Or any other DNS in your region which is reliable...

We increase the lease time to 90 hours instead of 10 (600 sec).

Scroll down a little bit and uncomment **authoritative;** line:

```
# If this DHCP server
# network, the autho
#authoritative; [I]
```

Than add these lines somewhere in the file:

```
subnet 192.168.1.0 netmask 255.255.255.0 {
range 192.168.1.50 192.168.1.240;
option routers 192.168.1.1;
option subnet-mask 255.255.255.0;

# No service will be given on this subnet, but declaring it helps the
# DHCP server to understand the network topology.

subnet 192.168.1.0 netmask 255.255.255.0 {
range 192.168.1.50 192.168.1.240;
option routers 192.168.1.1;
option subnet-mask 255.255.255.0;
}
```

CTRL X Save Y and exit it.

Now, open the **/etc/default/isc-dhcp-server** configuration file as follows:

```
$ sudo nano /etc/default/isc-dhcp-server
```

```
pi@raspberrypi:~ $ sudo nano /etc/default/isc-dhcp-server
```

Add, **eth0** to the **INTERFACESv4** variable and save the file.

```
pi@raspberrypi:~ ~
GNU nano 5.4          /etc/default/isc-dhcp-server *
# Defaults for isc-dhcp-server (sourced by /etc/init.d/isc-dhcp-server)

# Path to dhcpcd's config file (default: /etc/dhcp/dhcpcd.conf).
#DHCPDv4_CONF=/etc/dhcp/dhcpcd.conf
#DHCPDv6_CONF=/etc/dhcp/dhcpcd6.conf

# Path to dhcpcd's PID file (default: /var/run/dhcpcd.pid).
#DHCPDv4_PID=/var/run/dhcpcd.pid
#DHCPDv6_PID=/var/run/dhcpcd6.pid

# Additional options to start dhcpcd with.
#       Don't use options -cf or -pf here; use DHCPD_CONF/ DHCPD_PID instead
#OPTIONS=""

# On what interfaces should the DHCP server (dhcpcd) serve DHCP requests?
#       Separate multiple interfaces with spaces, e.g. "eth0 eth1".
INTERFACESv4="eth0"
INTERFACESv6=""

```
Hint: Selecting directories: add a slash to the end of the matching pattern.
pi@raspberrypi:~ $ 1Help 2Menu 3View 4Edit 5Copy 6RenMov 7Mkdir 8Delete 9PullDn 10Quit
```

After the IPTV patch the FTP access does not need a user/password combination and is open. So you can down- / upload new channel-lists and groups:

```
mc [pi@raspberrypi]:/ftp://192.168.1.50/res/json
Left   File   Command   Options   Right
<- ftp://192.168.1.50/res/json .[^]>
.n      Name          Size     Modify time
/..    UP--DIR Feb  8 12:25
*channelgroups-1.0.0.json 258  Feb  8 12:25
*channels-1.0.0.json    581  Feb  8 12:25
*settings-1.0.0.json   885  Oct 17 2019
```

SSH connectivity to the box and a few php commands after you entered into the IPTV Box by SSH:

User: **admin**

Password: **O9kAdBQcTH7q3kNh**

'O' not '0' !!!

```
pi@raspberrypi:~ $ sudo apt install putty-tools
Reading package lists... Done

Processing triggers for man-db (2.9.4-2) ...
```

Of course your PC (or the RASPI itself) with Putty installed (ssh comandline will also work) can establish the remote connection to the IPTV-STB:

```
login as: admin
admin@192.168.1.50's password:
execute ~/.profile ...
execute ~/.bashrc ...
# ls -la

#
```

Usefull ssh commands with PHP in the box:

- **Factory reset:**
php -r 'tncommon_startfactoryreset(0, "AreYouSure");'
- **Disable screensaver (ON by default):**
php -r 'tncommon_enablescreensaver(0);'
- **Print available php tncommon api functions:**
php -r 'print_r(get_extension_funcs("tncommon"));'

...

There are a lot more For the specialistst who knows php...

One essential file for the STB-Configuration is:

hybridset.txt and is linked /stored in an extra flash nonvolatile partition:

```
# ls -la
drwxr-xr-x  11 root    root      1744 Jul 27 2015 .
drwxr-xr-x  20 client  1001     1472 Jul 27 2015 ..
-rwxr-xr-x  1 root    root      199 Sep 18 2014 .bash_profile
-rwxr-xr-x  1 root    root      101 Sep 18 2014 .bashrc
-rwxr-xr-x  1 root    root      170 Sep 18 2014 .profile
-rwxr-xr-x  1 root    root     112 Apr 21 2015 311336
-rwxr-xr-x  1 root    root     112 Apr 21 2015 311713
-rwxr-xr-x  1 root    root     112 Apr 21 2015 311715
drwxr-xr-x  4 root    root      320 Jul 27 2015 abox42
drwxr-xr-x  3 root    root      240 Jul 27 2015 branded-apps
-rwxr-xr-x  1 root    root     161 Apr 21 2015 fakentp.sh

#
```

This file hybridset.txt is transferred with the IPTV patch from Omniscreen to this IPTV simple P&P design.

You can modify it to adjust eg. NTP-addresses and time/date/country settings. Please note, many of these config-entries are only for bigger installations with a middleware-server and extra hbbtv tools in the webkit browser and should not work here in the simple P&P setup:

```
[network]
#network.prefdns=208.67.222.222
network.prefdns=192.168.0.1
#network.ntp=time.abox42.com
#network.ntp=192.53.103.108
network.ntp=time.windows.com
#example: if you use a domain and no IP than DNS need to be connected and
configured properly, maybe better to use 192.53.103.108 or .104 in Germany
# hier sollten lokale Daten rein: DNS kann z.B. weltweit der Google sein 8.8.8.8
oder neutral 9.9.9.9, NTP Server sollte ein lokaler genommen werden.
# Kommentarzeilen die vom linux ignoriert werden fangen mit der raute an

[key]
```

```
#key.portal=http://localhost/nanoapps/branded/brandeddashboard/index.html
key.portal=http://localhost/developer/index.html
key.info=http://

[apps]
# the app which will be activated when the box startup.
FirstRunApp=portalstack
# the app which will be run
# for example: if we define RunPortal=portalstack, it means there is a portalstack
# directory under rootfs/root, a portalstack.sh file under the portalstack directory,
# support to start/stop/restart the subsystem.
#           And the app name of portalstack is /dbus/portalstack, the dbus name
# of portalstack is dbus.Portalstack, the path name of portalstack is
#/dbus/Portalstack, the interface name of portalstack is dbus.App
RunPortal=portalstack

# im Folgenden sollte z.B. die Timezone gesetzt werden - was das im einzelnen
alles macht weiss ich auch noch nicht

#server and port for vmx viewright web/ott
#vmweb.server=74.62.179.10
#vmweb.port=80

```

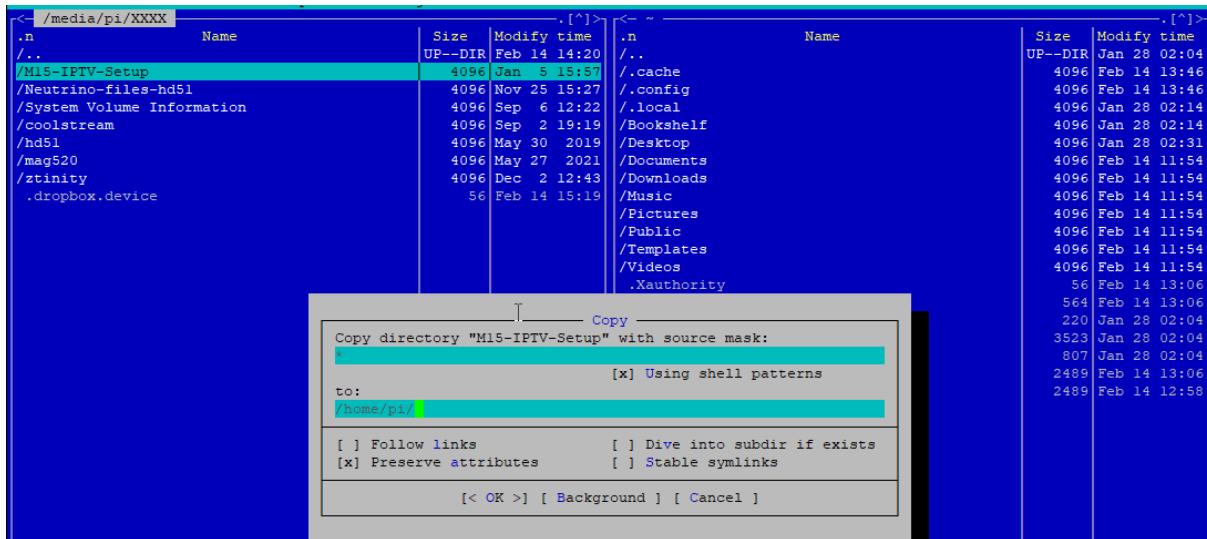

Back to the Raspi:

To use the RPI as the STB-Managing – unit, we copy the Box necessary content to it:

	abox_42_iptv_setup.sh	01.11.2019 01:00	SH-Datei	1 KB
	abox_42_iptv_setup.tar.gz	08.11.2019 09:50	GZ-Datei	1.657 KB
	channelgroups-1.0.0.json	30.10.2020 12:16	JSON-Datei	1 KB
	channelgroups-full.json	18.09.2020 15:45	JSON-Datei	2 KB
	channels-1.0.0.json	24.11.2021 14:07	JSON-Datei	1 KB
	channels-full.json	23.09.2020 12:17	JSON-Datei	38 KB
	hybridset.txt	25.11.2021 10:55	TXT-Datei	12 KB
	hybridset.txt.org	01.11.2019 01:54	ORG-Datei	11 KB
	IPTV_conf_abox42v6.pdf	01.11.2019 13:00	Adobe Acrobat D...	200 KB
	iptv_package.tar.gz	01.11.2019 00:39	GZ-Datei	1.651 KB

By using curl or any ftp or just a USB stick and MC:

The USB stick is almost likely auto mounted by the RPI:

After transfer they are located under a folder in the pi-home:

```
pi@raspberrypi:~ $ ls -la
total 88
drwxr-xr-x 15 pi pi 4096 Feb 14 14:22 .
drwxr-xr-x  3 root root 4096 Jan 28 02:04 ..
-rw-----  1 pi pi 564 Feb 14 13:06 .bash_history

pi@raspberrypi:~ $
```

We need to check the execution bit of the script:

```
pi@raspberrypi:~/M15-IPTV-Setup $ ls -la
total 3600
drwxr-xr-x  2 pi pi    4096 Jan  5 15:57 .
drwxr-xr-x 15 pi pi    4096 Feb 14 14:22 ..
-rw-r--r--  1 pi pi     958 Nov  1 2019 abox_42_iptv_setup.sh
-rw-r--r--  1 pi pi 1696072 Nov  8 2019 abox_42_iptv_setup.tar.gz
-rw-r--r--  1 pi pi    258 Oct 30 2020 channelgroups-1.0.0.json
-rw-r--r--  1 pi pi   1937 Sep 18 2020 channelgroups-full.json
-rw-r--r--  1 pi pi    581 Nov 24 15:07 channels-1.0.0.json
-rw-r--r--  1 pi pi  37918 Sep 23 2020 channels-full.json
-rw-r--r--  1 pi pi   11290 Nov 25 11:55 hybridset.txt
-rw-r--r--  1 pi pi   10625 Nov  1 2019 hybridset.txt.org
-rw-r--r--  1 pi pi 204128 Nov  1 2019 IPTV_conf_abox42v6.pdf
-rw-r--r--  1 pi pi 1690078 Nov  1 2019 iptv_package.tar.gz
pi@raspberrypi:~/M15-IPTV-Setup $
```

No it isn't !!! so we need to make it executable:

```
sudo chmod 755 abox_42_iptv_setup.sh:
```

```
pi@raspberrypi:~/M15-IPTV-Setup $ sudo chmod 755 abox_42_iptv_setup.sh
pi@raspberrypi:~/M15-IPTV-Setup $ ls -la
total 3600
drwxr-xr-x  2 pi pi    4096 Jan  5 15:57 .
drwxr-xr-x 15 pi pi    4096 Feb 14 14:22 ..
-rwxr-xr-x  1 pi pi     958 Nov  1 2019 abox_42_iptv_setup.sh
-rw-r--r--  1 pi pi 1696072 Nov  8 2019 abox_42_iptv_setup.tar.gz
-rw-r--r--  1 pi pi    258 Oct 30 2020 channelgroups-1.0.0.json
-rw-r--r--  1 pi pi   1937 Sep 18 2020 channelgroups-full.json
-rw-r--r--  1 pi pi    581 Nov 24 15:07 channels-1.0.0.json
-rw-r--r--  1 pi pi  37918 Sep 23 2020 channels-full.json
-rw-r--r--  1 pi pi   11290 Nov 25 11:55 hybridset.txt
-rw-r--r--  1 pi pi   10625 Nov  1 2019 hybridset.txt.org
-rw-r--r--  1 pi pi 204128 Nov  1 2019 IPTV_conf_abox42v6.pdf
-rw-r--r--  1 pi pi 1690078 Nov  1 2019 iptv_package.tar.gz
pi@raspberrypi:~/M15-IPTV-Setup $
```

Now we can use that to change values in an already DHCP-connected STB:

Example: we change the DNS in the hybridset.txt to google:

```
[network]
#network.prefdns=208.67.222.222
network.prefdns=8.8.8.8
#network.ntp=time.abox42.com
network.ntp=192.53.103.108
#network.ntp=time.windows.com
# hier sollten lokale Daten rein: DNS kann z.B. weltweit der Google sein 8.8.8.8
# oder neutral 9.9.9.9, NTP Server sollte ein lokaler genommen werden.
...
...
```

So we know the IP address of the box – but if not just tail -f /var/log/syslog

```
pi@raspberrypi:~/M15-IPTV-Setup $ ./abox_42_iptv_setup.sh 192.168.1.50
Uploading files...
Updating ABOX42 192.168.1.50...
send: spawn id exp4 not open
  while executing
"send "O9kAdBQcTH7q3kNh\r"""
Refreshing 192.168.1.50...
done
pi@raspberrypi:~/M15-IPTV-Setup $
```

Do the ./ before the *.sh script.

Hybridset.txt will be overwritten as well as the channels – and group.json – files which contains the channel-list and groups for the user:

That worked:

```
drwxr-xr-x    2 root      root          360 Jan   1 1970 .
drwxr-xr-x    9 root      root         2008 Feb   8 23:11 ..
-rw xr-xr-x    1 root      root          112 Jan   1 1970 311336
-rw xr-xr-x    1 root      root          112 Jan   1 1970 311713
-rw xr-xr-x    1 root      root        10037 Feb   8 23:25 hybridset.txt
# cat *.txt
[network]
#network.prefdns=208.67.222.222
network.prefdns=9.9.9.9
#network.prefdns=192.168.1.1      [
#network.ntp=time.abox42.com
#network.ntp=192.53.103.108
network.ntp=time.windows.com
# hier sollten lokale Daten rein: DNS kann z.B. weltweit der Google sein
genommen werden.
# Kommentarzeilen die vom linux ignoriert werden fangen mit der raute an
```

DNS changed to 9.9.9.9 ... ping it ;-)

Ntp time to time.windows.com

So that's all for the moment,

- You now have a DHCP-Server and STB config manager by a RASPBERRY PI

some more stuff in the other PDF...

IPTV-Multicast-OMM15_Manual.1.4.pdf
